

## **Endoscopic Vitrectomy in Retinal Detachment in Eyes with Keratoprosthesis**

*Author: Anselm Jünemann*

The management of retinal detachment in eyes with opaque media remains a challenge. In case of cataract, vitrectomy with simultaneous phacoemulsification is recommended. In patients with corneal opacities, keratoprosthesis is an optional procedure. In patients with keratodontology, there is no possibility to improve the insight into the eye via the anterior segment. This poster presents the management of retinal detachment in eyes with keratoprosthesis using endoscopic vitrectomy.
