

A New Surgical Approach in the Management of Posteriorly Dislocated Intraocular Lenses

Tansu Erakgun, MD (Izmir, Turkey)

SYNOPSIS

I herein report on one patient a new surgical technique in the management of dislocated PCIOLs consisting retrieval from the vitreous cavity, followed by repositioning of the intraocular lens with minimal tissue damage and complications. The instrument used consists of a backflush flute needle with active aspiration which has a modified tip of 45 degrees.
