

Surgical Management of Iris-diaphragm Intraocular Lens Luxation

Jerzy A. Mackiewicz, MD (Lublin, Poland), Ewa Rakowska, MD (Lublin, Poland)

SYNOPSIS

The film shows fragments of two surgical procedures on the left eye of 28 y.o. man with iris-diaphragm intraocular lens, type Morcher, luxated into the vitreous. The first part shows vitrectomy with decaline injection, lens shifting to the anterior chamber and transscleral fixation. The second part of the film shows vitrectomy with silicone oil tamponade, because of retinal detachment developed 2 months after first procedure.
