

Vitreous Cutter-assisted Triamcinolone and/or PFCL Infusion

Spyridon Mourtzoukos, MD (Athens, Greece), Giorgos Morphis, MD (Athens, Greece),
Manolis Gogos, MD (Athens, Greece), Elias Feretis, MD (Athens, Greece)

SYNOPSIS

During vitrectomy the vitreous cutter may be removed and a blunt needle is inserted to inject substances in the vitreous cavity such as triamcinolone, or PFCL. In our technique, the aspiration tube was disconnected from the vitrector and triamcinolone or PFCL was injected through this entry via a syringe. Consequently, the aspiration tube of the vitreous cutter was connected again and the vitrectomy was continued.
