Interest of the use of 25 Gauge vitrectomy technique in diabetic retinopathy

Author: Jean Pierre Hubschman, Rita Soyeur

The transconjunctival vitrectomy system presents some real advantages in cases of diabetic retinopathy. In fact, this new technique without conjunctival opening nor closing is perfectly adapted for most of vitreo-retinal surgical cases in diabetic retinopathy. Now, we have the opportunity to perform less traumatic vitreo-retinal surgery in tractional macular edema and moderate proliferative retinopathy, it means less inflammatory and less complicated.
